

In this project, we will build out a Tournament Shopping Cart (TSC) on NSD. An initial version of the shopping cart can be seen [on one of our website's Debate Land](#). Debate Land (DL) is a free resource we created to give debaters rankings and statistics on how they and their competitors are performing at tournaments throughout the season. Currently, the TSC on DL is like a nice spreadsheet with some filters, but it lacks any personalization and is not catered towards parents (e.g., how much will going to this tournament cost?). These tournament calendars get around 700 unique monthly visitors during the debate season and we think there is the possibility of generating significantly more user traction.

Overview

We will allow users to input their preferences to show a filtered list of tournaments to the user. User preferences include 1) date availability, 2) region/distance, 3) cost.

For each tournament in the filtered list, we will show the user potential flights & hotels that they can book, and use this information to estimate a price.

Requirements

- Build a collection containing tournament name, dates, starting time, and location
 - This data can be manually grabbed from the Debate Land website
- Filter the collection based off of user preferences
 - The dates filter should be straightforward
 - Users can filter by region, state, or distance:
 - Region – each tournament can be put into a region (based off of the location)
 - Note: the region can be stored in the collection or computed on the fly
 - State - straightforward. Note: all 50 states in the US + District of Columbia should be included.
 - Distance - we will get the user's zip code. This can be used to estimate the distance to the tournament location
 - Can use a library or 3rd part API (e.g., Google Maps) to estimate distance
- For each tournament that passes the filters, find 3-6 potential flights and 1-3 potential hotels the user can take
 - Flights should arrive at least 4 hours before the tournament start time, and at most 24 hours before the tournament start time
 - Representatively sample from the flights based on price
 - I.e., if showing 3 flights, show 1 cheap, 1 medium, and 1 expensive flight
 - Similar can be done for hotels
 - Hotels should be at most 25 miles from tournament location. Prioritize nearby hotels
 - Similarly sample cheap, medium, and expensive hotels
 - Propose a method to cache results for flights/hotels

- Use the flights and hotels to estimate the cost of attending the tournament
- Users can “select” tournaments to “create” their own schedule, and they can they export this list (i.e., get it emailed)

Design

Please work to create a Figma design of the UI/UX for the Tournament Shopping Cart. This should include:

- Initial landing page
 - Image, quick 3 steps for how to use the TSC, and perhaps a sample output for users to easily see the output
- All filter displays (can possibly be a pop-up modal)
- Tournament filtered list display
 - Tournament info, flight/hotel information when user wants to see the “details” of the tournament
 - Users can “add” tournaments to their “schedule”. They can email the list to themselves

Outputs

- Complete the project on a tech stack that is fully provisioned by the team
 - I.e., create a separate Webflow project, MongoDB collection, APIs, etc.
- Optional “bonus” features - if you’d like to show us your capabilities above and beyond the core project, here are bonus features we’d love to see you build:
 - Implement GA4 conversion tracking:
 - Track how many people start the user-preference flow, and how many people finish it
 - Create a GA4 report showing results
 - Implement a mobile UI (including Figma design)
 - Allow users to email themselves a created schedule
 - Force users to create an account to do this. Enable Google OAuth + regular email/pass sign-up
 - Allow users to “save” created schedules (even incomplete or in-progress ones) to their account, and create a dashboard view of their saved schedules
 - Users can export, modify, delete these schedules

Workflow

Shubham will actively manage the development and will be the point of contact for any questions from the tech team:

Meetings

We will have one kick-off call to ensure everyone’s aligned on requirements, timeline, and expectations. Shubham will schedule a once-a-week 60-minute check-in with the team. In these meetings, the team can provide updates to Shubham and ask clarification questions. Shubham will also use these meetings to provide feedback on the ongoing work.

Please choose one of the following timeslots. These will be filled on a first-come-first-serve basis:

- Tuesday from 9-10 pm CST
- Tuesday from 10-11 pm CST
- Wednesday from 9-10 pm CST
- Wednesday from 10-11 pm CST

Async Progress Monitoring

- Please onboard me to the task tracking software the team is using (e.g., JIRA)
- Please track time spent on all tasks. This can be done on a software like [Toggl](#). Timesheets should be shared weekly.
 - Some best practices for Time Tracking:
 1. Use Toggl or an analogous software. Toggl is free.
 2. Make the subject the JIRA Ticket Number
 3. Round off your tracking to 30 minute increments
 - a. E.g., if you worked on a task from 5:50 - 7:28, you can track this as 6:00 - 7:30
 4. No need to use Tags/Projects
 5. Export a detailed PDF report
